Entry-level Machine Learning / AI Engineer and aspiring Solutions Architect with a Bachelor's degree in Computer Science, focused on AI/ML, data analytics, and system design. Strong foundation in Python, Java, machine learning fundamentals, and system testing gained through academic projects and implementation-based coursework. Involved in workflow design, data analysis, and software validation within project environments, with an emphasis on translating requirements into structured system solutions. Demonstrates analytical thinking, problem-solving, and system-level understanding of how components interact in end-to-end workflows. Seeking opportunities in AI engineering, data science, and solutions architecture.

Work Experience

Freelance

Hong Kong / Remote

Instructional Content Developer

02/2023 - 03/2026

- Reviewed and analyzed 50+ websites to produce 500+ instructional video tutorials that simplified website, platform, and system workflows for users across multiple industries.
- Monitored YouTube analytics, including views, engagement, and content performance, to identify effective topics and improve future video planning.

NOAH Business Applications

Makati City, Philippines

Intern Junior Developer

06/2025 - 07/2025

- Designed and executed BRTS test scripts to validate system workflows, identify defects, and ensure reliable software functionality.
- Supported 3 implementation projects by performing system testing, preparing user scenario guides, and managing project-related data.

Education

Saint Louis University

Baguio City, Philippines

Bachelor of Science, Computer Science

08/2022 - 07/2026

- Vice President, ICON Organization | University-wide IT, CS, and Multimedia Arts student organization

Skills

Programming Languages: Python, Java, JavaScript, C#, PHP, SQL

AI & Data Analysis: RT-DETRv2, YOLOv11, YOLOv8, Power BI, Google Colab, JupyterLab

Web & Mobile Development: React.js, Node.js, HTML, CSS, Kotlin, Android Studio, Jetpack Compose

Databases & Tools: MySQL, PostgreSQL, Git, GitHub, VS Code, IntelliJ IDEA

Projects

Cloud-Based Road Damage Detection System

- Developed a cloud-based road damage detection system for detecting potholes, cracks, alligator cracks, and ravelling in Philippine road images.
- Integrated RT-DETRv2 model inference with a mobile app, GIS-based mapping workflow, and severity assessment for road damage reporting.

Philippine Road Damage Classification

- Developed a YOLOv11-based road damage classification model using locally sourced Philippine road damage datasets.
- Presented and published the research at the ATIFTAP 19th Global Business Conference.

Abstractive Text Summarization

- Trained and evaluated a multilingual abstractive summarization model using Tagalog and Cebuano movie review datasets. Processed 50,000+ text records for model training, preprocessing, and evaluation.
- Presented the paper at ICIBER Inc.

Transportation Network Anomaly Analysis

- Analyzed 300,000+ transportation records to detect anomalies and uncover movement patterns.
- Applied DBSCAN clustering and GIS-based analysis to identify route behavior and transportation patterns.

Last-Mile Delivery Performance Analytics Dashboard

- Built a Power BI dashboard analyzing 331,415 last-mile delivery records to evaluate delivery time, courier productivity, regional performance, and delay patterns.
- Designed a star schema data model and created DAX measures for fleet averages, courier ranking, efficiency labels, and delivery duration analysis.

Publications

Yolov11-based Mobile Application for Damage Classification and Severity Level Identification of Roads in The Philippines 11/2025

Built a YOLOv11-based Android road damage detection system using localized Philippine road data, achieving 86% accuracy on unseen images.
